

Git Workflow

Rules

- **main** branch is protected, no one (including owners) can push directly to main.
- all changes go through via PR (Pull Request) with at least one reviewer.
- individuals can't approve their own Pull Requests.

Day-To-Day Workflow

1. Clone the assigned repository (if not cloned already):

```
git clone https://github.com/Sijill/sijill-[NAME].git
cd sijill-[NAME]
```

2. Sync with the remote repository main branch before doing any work

```
git switch main //switches to main branch
git pull origin main //pulls changes from remote repository
```

3. Create a new branch (following the standard naming rules)

```
git branch [type/branch-name] //creates a new branch
git switch [type/branch-name] //switches to the new branch
```

4. Do your work (write code, make changes, etc....)

Make sure you have a focused reasonable scope and don't dump the whole project at once.

```
git status //check changes and commit status
```

5. Commit locally

```
git add . //move changes to stagin area
git commit -m "[commit-message]" //following commit messages standard pattern
```

6. Push branch to GitHub

```
git push -u origin [type/branch-name] //create branch on GitHub repo & links to it
```

7. Open a Pull Request

Compare branch: [type/branch-name] --> Base branch: **main**.

PR description must include:

- what changed ?
- why it changed ?
- will it affect any dependencies ?

8. Review phase

For effective **PR** review:

- **PR** description must contain (what + why).
- scope should be reasonable (not multiple unrelated features).
- branch naming + commit messages follow standards.
- no logic added outside repository responsibility.
- contracts between client & server are respected.
- no secrets committed.

9. Update PR if needed (reviewer rejected)

```
//fix code, make changes, etc....  
git add .  
git commit -m "[fix:content]"  
git push
```

(PR updates automatically, no new PR needed)

10. Merge the PR

Once the **PR** is approved use Squash and Merge for a clean history.

Delete the branch after merged.

11. Sync after merging

```
git switch main //switch to main branch  
git pull origin main //pull new changes from remote to local  
git branch -d [type/branch-name] //delete the old branch locally  
git push origin --delete [type/branch-name] //delete the branch from remote
```
